FL-01 Workflow Audit

Adarsh | B.Tech CSE (AI & ML), Graphic Era University, Dehradun | Phase: Setup

1. Task audit

Classification key: **Just me** (I do it alone), **Delegate** (AI does it, I review), **Collaborate** (we work on it together), **Automate** (AI does it end to end).

#	Recurring task	Classification	Rationale
1	Solving a fresh DSA problem (finding the core insight)	**Just me**	Pattern recognition is the skill I am training; if AI does it, I learn nothing.
2	Getting unstuck after a fixed time limit on a problem	**Collaborate**	I want graduated hints, not solutions, so I avoid both jumping to the answer and losing 1-2 hours.
3	Implementing a solution in C++/Python once the logic is mine	**Collaborate**	AI is useful for edge cases and subtle semantics, but I write the first version.
4	Debugging TLE/WA on contest-style problems	**Collaborate**	Fast at spotting complexity or off-by-one issues, but I must understand the fix.
5	Writing post-solve notes (pattern, trick, mistake)	**Delegate**	AI drafts the write-up; I check it matches what I actually learned.
6	Planning contest prep (e.g., HackWithInfy topics and schedule)	**Collaborate**	AI structures the plan; I know my weak topics and available time.
7	Writing and tightening resume bullets	**Collaborate**	I supply the facts, AI sharpens wording; every claim must be true and traceable.
8	Fixing LaTeX resume formatting (one page, ATS-safe)	**Delegate**	Mechanical and easy to verify by compiling and checking the PDF.
9	Building portfolio UI components (React/Tailwind)	**Delegate**	Fast to generate, but must be checked against my existing design system.
10	Deciding what the portfolio showcases and how it looks and feels	**Just me**	Taste and personal positioning cannot be outsourced.
11	Choosing which resume project to build (PR reviewer, RAG, etc.)	**Collaborate**	AI helps compare scope and stack, but I own the decision since I must defend it in interviews.
12	Drafting internship and course reports (.docx)	**Delegate**	AI structures it from my repo and notes; I verify every factual claim.
13	Viva prep (e.g., compiler construction: TAC, backpatching)	**Collaborate**	AI quizzes and probes me; I explain the answers aloud myself.
14	Repo scaffolding and README skeletons	**Automate**	Low stakes and repetitive; a quick skim catches any problem.
15	Messages to recruiters, referrals, and seniors	**Just me**	Voice and relationships matter; generic AI tone would hurt more than help.

Honest note on "Just me": tasks 1, 10 and 15 stay mine because the value is in the doing (skill-building, taste, and personal voice). Only one task is fully automated, because most of my work has facts or skills that need my judgment.

2. Claude Project: custom instructions

I'm Adarsh, a B.Tech CSE (AI & ML) student at Graphic Era University, Dehradun, graduating in 2026. I interned in AI backend engineering at FlyRank. I'm interested in both full-stack development and ML/AI applications.

***Current goals:** (1) get placement-ready, (2) build one strong resume project, (3) build independent DSA problem-solving rather than depending on solutions.*

***How to respond:** Be direct and terse, with no filler or flattery. Tell me plainly when my approach is wrong. For code, give complete, production-ready code with no placeholders or truncation. For DSA, build the logic with me first and give graduated hints before any solution. For resume text, keep it specific, jargon-free and scannable, and never invent achievements. For design feedback, I give blunt feedback and expect the same.*

3. Target tasks for FL-02 to FL-04, with success definitions

A. DSA stuck-point coaching (task 2, Collaborate)

- I bring a problem I have been stuck on for 30+ minutes; AI gives at most 3 graduated hints and no full solution.
- I solve it myself within 45 more minutes.
- The next day I can explain the key insight from scratch without notes.

B. Resume bullets for one project (task 7, Collaborate)

- Each bullet is two lines or fewer and names a concrete technology or number.
- Every claim traces to something in my repo or work: zero fabricated details.
- The resume stays on one page and compiles cleanly.

C. Portfolio component delegation (task 9, Delegate)

- The component uses only my existing design tokens (#18181b, #7dd3c0, Space Grotesk, JetBrains Mono); no new colors or decoration.
- It runs with no console errors and looks correct at mobile, tablet and desktop widths.
- It is accepted within 2 revision rounds.
